

Phase 8: Project Demonstration

Stakeholder Communication & User Feedback Channels

1. Communication Objectives

Clear and proactive communication ensures that users, project evaluators, and stakeholders understand the application's capabilities, progress, and output formats.

2. Multi-Channel Communication Matrix

Stakeholder / Audience	Touchpoint / Mechanism	Message & Information Delivered	Tone & Style
End Users (Storytellers)	Web GUI (/)	Clear value proposition, guidance on setting story parameters, and 1-click presets.	Creative, encouraging, user-friendly.
Active Users (Generating)	Dynamic Loading Overlay	Real-time feedback with comic sound effects (POW!, ZAP!) and step descriptions (Outlining, Writing, Inking, Compiling).	Engaging, transparent, entertaining.
Active Users (Reviewing)	Comic Preview Page (/generate)	Complete sequential visual comic, panel titles, speech bubbles, narrative cards, and prominent download buttons.	Immersive, clean, celebratory.
Active Users (Exporting)	Export Success Page (/export-success)	Confirmation of file creation, filename display, re-download link, and option to create another story.	Rewarding, encouraging retention.
Developers & Evaluators	Swagger UI (/docs) & Terminal	OpenAPI specifications, HTTP status codes, structured JSON payloads, and clean logging.	Technical, structured, rigorous.

3. Feedback Loop & System Notifications

1. Validation Warnings: If any required field is missing, client-side HTML5 validation immediately alerts the user with descriptive prompts.
2. Graceful Exception Display: If an upstream model or network failure occurs, the server catches the exception and renders an alert card on the homepage instead of showing an unformatted 500 error page.
3. Download Confirmation: Explicitly informs the user where their file is saved, providing the exact timestamped PDF filename.
